Assignment:

1. A framework is a foundational structure designed to support the development of software applications. It provides a standard way to build and deploy applications, reducing the need for repetitive coding.
   Using a framework for web development encourages rapid development and clean, pragmatic design. It helps developers take applications from concept to completion as quickly as possible.
2. Features of django framework are:
   - MVC (Model-View-Controller) is implemented as MVT (Model-View-Template) in Django.
   - Encourages reusability and modularity by reducing code redundancy.
   - Allows interaction with databases using Python classes instead of SQL queries.
   - Auto-generated admin interface for managing database records.
   - Easily integrates with caching, NoSQL databases, and other technologies for scaling.
     And many more
